17 UNITED STATES DISTRICT COURT FOR THE CENTRAL DISTRICT  
18 OF CALIFORNIA – WESTERN DIVISION  
19

20 AMERICA UNITES FOR KIDS, and  
21 PUBLIC EMPLOYEES FOR  
22 ENVIRONMENTAL RESPONSIBILITY,

23 Plaintiffs,

24 v.

25 SANDRA LYON, IN HER OFFICIAL  
26 CAPACITY AS SUPERINTENDENT OF  
27 THE SANTA MONICA MALIBU  
28 UNIFIED SCHOOL DISTRICT, JAN  
MAEZ, IN HER OFFICIAL CAPACITY  
AS ASSOCIATE SUPERINTENDENT  
AND CHIEF FINANCIAL OFFICER OF  
THE SANTA MONICA MALIBU  
UNIFIED SCHOOL DISTRICT, AND

Case No. 2:15-CV-2124

**COMPLAINT FOR  
DECLARATORY AND  
INJUNCTIVE RELIEF FOR  
VIOLATION OF TOXIC  
SUBSTANCES CONTROL  
ACT**

1 LAURIE LIEBERMAN, DR. JOSE  
 2 ESCARCE, CRAIG FOSTER, MARIA  
 3 LEON-VAZQUEZ, RICHARD  
 4 TAHVILDARAN-JESSWEIN, OSCAR  
 5 DE LA TORRE, AND RALPH MECHUR,  
 6 IN THEIR OFFICIAL CAPACITIES AS  
 7 MEMBERS OF THE SANTA MONICA  
 8 MALIBU UNIFIED SCHOOL DISTRICT  
 9 BOARD OF EDUCATION,

Defendants.

10 Plaintiffs America Unites for Kids (formerly Malibu Unites) (“American  
 11 Unites”) and Public Employees for Environmental Responsibility (“PEER”), on  
 12 behalf of themselves and their members, allege as follows:

### 13 **JURISDICTION, NATURE OF THE ACTION AND VENUE**

14 1. This Court has jurisdiction over this action pursuant to 28 U.S.C. §1331  
 15 (federal question), 28 U.S.C. §2201 (declaratory judgment), and 15 U.S.C. §2619  
 16 (TSCA citizen suit provision).

17 2. This is a citizen suit under the Toxic Substances Control Act  
 18 (“TSCA”), 15 U.S.C. §2619, seeking to restrain ongoing violations of TSCA and its  
 19 implementing regulations by the Defendants, administrators and members of the  
 20 Board of Education of the Santa Monica Malibu Unified School District  
 21 (“SMMUSD” or “District”). The ongoing violations of TSCA stem from the  
 22 continued use at Malibu Middle and High School (“MHS”) and Juan Cabrillo  
 23 Elementary School (“JCES”) (collectively “Malibu Schools”) of polychlorinated  
 24 biphenyls (“PCBs”) in caulk and other building materials at concentrations of  
 25 greater than 50 parts per million, other than in a totally enclosed manner, as well the  
 26 continued use of materials with surfaces having PCB concentrations in excess of 10  
 27 micrograms (ug) per 100 square centimeters (cm<sup>2</sup>).  
 28

1           3.     Plaintiffs seek declaratory and injunctive relief requiring Defendants to  
2 cease ongoing violations of TSCA by removing all building materials which violate  
3 TSCA and its implementing regulations from the Malibu Schools.

4           4.     Venue is proper under 15 U.S.C. §2619(a)(2) because this is the district  
5 in which the alleged violations are ongoing, and in which Defendants have their  
6 principal place of business.

7           5.     Plaintiffs will also be filing a Motion for Preliminary Injunction,  
8 seeking immediate removal of caulk which has already been determined by  
9 laboratory testing to contain PCBs in excess of legal limits, and an application for  
10 Expedited Discovery under Fed. R. Civ. P. 34(a)(2) to enter the Malibu Schools and  
11 sample and test building materials to determine whether illegal levels of PCBs exist  
12 in those materials.

13          6.     Plaintiffs gave notice of the Administrator of the Environmental  
14 Protection Agency ("EPA") and the Defendants of the alleged violations more than  
15 60 days prior to the filing of this Complaint, in accordance with 15 U.S.C. §2619(b)  
16 and 40 C.F.R. 702.62 (1982).

### 17 18                                   **PARTIES AND STANDING**

19          7.     Plaintiff America Unites for Kids (formerly Malibu Unites) is a non-  
20 profit 501(c)(3) organization incorporated in California with members and  
21 supporters who are parents, teachers and community members at the Malibu  
22 Schools. The mission of America Unites is to ensure environmental health  
23 excellence in schools for all children and those that educate them. Members of  
24 America Unites are injured by the ongoing violations of TSCA at the Malibu  
25 Schools because they have children who attend school in classrooms with illegal  
26 levels of PCBs, which have been found to cause cancer and have other serious  
27 health effects, or because they have been forced to withdraw their children from the  
28

1 Malibu Schools in order to avoid exposure to illegal levels of PCBs, or because they  
2 teach in those classrooms.

3 8. Plaintiff Public Employees for Environmental Responsibility (PEER) is  
4 a non-profit 501(c)(3) educational and advocacy organization, incorporated in  
5 Washington, D.C., which advocates for public employees concerned with  
6 environmental issues, including the "Concerned Malibu/Cabrillo Teachers," a group  
7 of 30 teachers and staff at the Malibu Schools. Members of PEER, including  
8 teachers and staff and the Malibu Schools, are injured by the ongoing violations of  
9 TSCA at the Malibu Schools because they work in classrooms which have illegal  
10 levels of PCBs, which have been found to cause cancer and have other serious  
11 health effects.

12 9. Defendant Sandra Lyon is the Superintendent of the SMMUSD, and is  
13 engaged in ongoing violations of TSCA by permitting and failing to act to remedy  
14 the unauthorized use of materials containing illegal levels of PCBs in the Malibu  
15 Schools. She is being sued in her official capacity.

16 10. Defendant Jan Maez is the Associate Superintendent and Chief  
17 Financial Officer of the SMMUSD, and is engaged in ongoing violations of TSCA  
18 by permitting and failing to act to remedy the unauthorized use of materials  
19 containing illegal levels of PCBs in the Malibu Schools. She is being sued in her  
20 official capacity.

21 11. Defendants Laurie Lieberman, Dr. Jose Escarce, Craig Foster, Maria  
22 Leon-Vazquez, Richard Tahvildaran-Jesswein, Oscar De La Torre and Ralph  
23 Mechur are members of the SMMUSD Board of Education, and are engaged in  
24 ongoing violations of TSCA by permitting and failing to act to remedy the  
25 unauthorized use of materials containing illegal levels of PCBs in the Malibu  
26 Schools. They are being sued in their official capacities.

27 ///

28 ///

## LEGAL BACKGROUND

12. Congress enacted TSCA in 1976, 15 U.S.C. §2601 *et seq.*, to “regulate chemical substances and mixtures which present an unreasonable risk of injury to health or the environment.” 15 U.S.C. §2601(b)(2).

13. PCBs are the only chemical which Congress specifically identified for regulation under TSCA. TSCA imposed a near-total ban on PCBs because Congress determined that the chemical and toxicological properties of PCBs posed a significant risk to public health and the environment. 15 U.S.C. §2605(e)(2)(A) states:

Except as provided under subparagraph (B), effective one year after the effective date of this Act [January 1, 1977] no person may manufacture, process, or distribute in commerce or use any polychlorinated biphenyl in any manner other than in a totally enclosed manner.

14. In TSCA, in subparagraph B referenced in the preceding quotation, Congress gave EPA the authority to promulgate rules granting exceptions to the statute’s PCB ban, upon a finding that a particular manufacture or use of non-totally enclosed PCBs “will not present an unreasonable risk of injury to health or the environment.” 15 U.S.C. §2605(e)(2)(B); §2605(e)(3)(B).

15. TSCA requires that any EPA exceptions to its PCB prohibition be promulgated in a rulemaking proceeding in accordance with the notice and comment requirements of the Administrative Procedure Act (APA). 15 U.S.C. §2605(e)(4); §2605(c)(2). Any exceptions to TSCA’s PCB ban are judicially reviewable under the APA and must be supported by substantial evidence. *E.g. Environmental Defense Fund, Inc. v. EPA*, 636 F.2d 1267 (D.C. Cir. 1980).

16. In the rules implementing TSCA’s PCB ban (“PCB Regulations”), the EPA Administrator found based on the documented scientific evidence that any use

1 of items containing PCBs at 50 ppm or greater did pose an unreasonable risk of  
 2 injury to health. The Administrator found:

3 that the manufacture, processing, and distribution in  
 4 commerce of PCBs at concentrations of 50 ppm or greater  
 5 and PCB Items with PCB concentrations of 50 ppm or  
 6 greater present an unreasonable risk of injury to health  
 7 within the United States. This finding is based upon the  
 8 well-documented human health and environmental hazard  
 9 of PCB exposure, the high probability of human and  
 10 environmental exposure to PCBs and PCB Items from  
 11 manufacturing, processing, or distribution activities; the  
 12 potential hazard of PCB exposure posed by the  
 13 transportation of PCBs or PCB Items within the United  
 14 States; and the evidence that contamination of the  
 15 environment by PCBs is spread far beyond the areas where  
 16 they are used. . . .

17 40 C.F.R. 761.20 (emphasis added).

18 17. “PCB Item” is defined in the PCB Regulations to mean “any PCB  
 19 Article, PCB Article Container, PCB Container, PCB Equipment, or anything that  
 20 deliberately or unintentionally contains or has as a part of it any PCB or PCBs.” 40  
 21 C.F.R. 761.3 (1999) (emphasis added). “PCB Items” include PCB-containing  
 22 building materials such as caulk.

23 18. 40 C.F.R. 761.20(a) expressly provides that, except for certain limited  
 24 situations not applicable here, “[n]o person may use any PCB, or any PCB item  
 25 regardless of concentrations, in any manner, other than in a totally enclosed manner  
 26 within the United States unless authorized under [40 C.F.R. 761.30].” 40 C.F.R.  
 27 761.20(a) refers to 40 C.F.R. 761.3, which excludes from regulation PCB products  
 28

1 containing less than 50 ppm PCBs. None of the exceptions in 40 C.F.R. 761.20(a)  
2 apply to PCBs at concentrations greater than 50 ppm.

3 19. Exclusions to the ban on the use of PCBs and PCB Items are also  
4 found in 40 C.F.R. 761.30 (2012). *See* 40 C.F.R. 761.20(a). 40 C.F.R. 761.30  
5 (2012) contains exemptions for the use of materials containing PCBs in  
6 concentrations of 50 ppm or greater which are not totally enclosed in limited  
7 circumstances in uses such as in transformers and natural gas pipeline systems. 40  
8 C.F.R. 761.30 (2012). None of the exceptions permitting the use of materials  
9 containing PCBs in concentrations of 50 ppm or greater applies to caulk or other  
10 building materials.

11 20. TSCA defines “totally enclosed manner” as a manner that “will ensure  
12 that any exposure of human beings or the environment to a [PCB] will be  
13 insignificant as determined by the Administrator rule.” 15 U.S.C. §2605(e)(2)(C).  
14 In the PCB Regulations, the EPA Administrator found that the exception from the  
15 PCB ban for totally enclosed PCB Items applies only to situations where there is  
16 zero exposure to humans or the environment. 40 C.F.R. 761.20 provides as follows:

17 For purposes of determining which PCB Items are totally  
18 enclosed, pursuant to section 6(e)(2)(C) of TSCA, since  
19 exposure to such Items may be significant, the  
20 Administrator further finds that a totally enclosed manner  
21 is a manner which results in no exposure to humans or the  
22 environment to PCBs.

23 (emphasis added). PCBs in caulk and other building materials result in exposure to  
24 humans or the environment to PCBs. Thus, the use of PCBs in caulk and other  
25 building materials is not a use in a totally enclosed matter under TSCA.

26 21. EPA has publicly confirmed that caulk and other building materials  
27 containing PCBs at levels at or over 50 ppm are not authorized for use under the  
28 PCB Regulations and must be removed and disposed of in accordance with those

1 Regulations. EPA has consistently stated, “[t]he use of PCBs in caulk is not  
2 authorized under TSCA’s PCB regulations.” EPA, Facts about PCBs in Caulk,  
3 [www.epa.gov/pcbsincaulk/guide/guide-sect1.htm](http://www.epa.gov/pcbsincaulk/guide/guide-sect1.htm).

4 22. The PCB Regulations applicable to materials containing 50 ppm or  
5 greater PCBs also apply to “PCB Contaminated” materials which contain PCBs at  
6 greater than 50 ppm or have surface PCB concentrations of greater than 10 ug per  
7 100 cm<sup>2</sup>. 40 C.F.R. 761.1(b)(3) (1999); 761.3.

8 23. When PCBs are found at levels which violate the PCB Regulations,  
9 they must be removed and disposed of in accordance with the PCB disposal  
10 regulations. 40 C.F.R. 761.61 (2009); 41 C.F.R. 761.62 (2009).

11 24. For PCB “Remediation Waste,” which includes soil and building  
12 materials contaminated with PCBs, the PCB disposal regulations include a site  
13 characterization in which materials are sampled to identify the nature and extent of  
14 the contamination. 40 C.F.R. 761.61(a)(3). If PCB Remediation Waste is sought to  
15 be disposed of in any manner not specifically prescribed by the regulation, an  
16 application to do so must be approved by EPA upon a finding that “the method will  
17 not pose an unreasonable risk of injury to health or the environment.”

18 25. If PCB “Bulk Product Waste,” which includes PCB-containing caulk,  
19 is sought to be disposed of in any manner not specifically prescribed by the  
20 regulation, an application to do so must be approved by EPA upon a finding that  
21 “the method will not pose an unreasonable risk of injury to health or the  
22 environment.” 40 C.F.R. 761.62(c)(2).

23 26. There are no regulatory standards for PCB concentrations in indoor air.  
24 Rather, the statutory and regulatory scheme is directed at prohibiting the  
25 manufacture, distribution and continued use of materials containing PCBs, and  
26 providing for their proper storage and disposal. There are no exceptions to the  
27 statutory and regulatory prohibitions based on whether or not, or to what extent,  
28 PCB-containing materials are causing contamination of indoor air or dust.

1        27. By informal means, such as posting on its website, EPA has created  
2 “suggested public health levels” for PCBs in indoor air in schools. These suggested  
3 levels assume that there are not additional PCB exposures above background levels  
4 from dust, soil or outdoor air. EPA has cautioned that the “suggested public health  
5 levels” should be used with “an appreciation of the uncertainty surrounding the  
6 estimates,” and that they do not take into account direct ingestion or contact with  
7 contaminated building materials. EPA’s “PCBs in Caulk – Q & A” [http://www.epa.gov/pcbsincaulk/pdf/caulk\\_faq.pdf](http://www.epa.gov/pcbsincaulk/pdf/caulk_faq.pdf), p. 12 ¶¶ 38, 40.

9        28. The “suggested public health levels” of PCBs for indoor air in schools  
10 have no regulatory basis and do not affect the statutory and regulatory scheme under  
11 TSCA which prohibits the continued use of any building materials containing PCBs  
12 in concentrations of 50 ppm or greater or surface concentrations of greater than 10  
13 ug per 100 cm<sup>2</sup>.

14        29. Apart from having no regulatory basis, the “suggested public health  
15 levels” for PCBs in indoor air are not appropriate for use in Malibu because, among  
16 other reasons, they do not take into account the following: additional exposure  
17 pathways known to exist in Malibu, such as elevated concentrations of PCBs on  
18 building surfaces and in dust and outdoor soil; direct contact with (touching) and  
19 possible ingestion of materials containing PCBs by children; risks to the unborn  
20 children of pregnant teachers (the “suggested public health levels” are based on the  
21 age of the children in the classroom); and because they are based on levels of total  
22 PCBs and do not take into account exposure to far more toxic, dioxin-like  
23 congeners, which have been found in the Malibu Schools.

24        30. TSCA makes it unlawful to fail to comply with its provisions or any  
25 regulation promulgated under the Act. 15 U.S.C. §§ 2614; 2689. TSCA provides  
26 for civil penalties for such violations of not more than \$25,000 for each day of  
27 violation, and for knowing and willful violations, in addition to or in lieu of the civil  
28

1           31. TSCA provides for citizen suits against any person or entity alleged to  
2 be in violation of TSCA to restrain violations of the Act, which may be filed after at  
3 least 60 days' notice of the violation to the alleged violator and the Administrator of  
4 EPA. 15 U.S.C. § 2619.

5           32. On January 12, 2015, Plaintiffs America Unites and PEER served a  
6 Notice of Intent to Sue the Defendants for ongoing violations of TSCA and its  
7 implementing regulations by the continued use at Malibu Middle and High School  
8 and Juan Cabrillo Elementary School of PCBs in caulking materials at  
9 concentrations of greater than 50 parts per million other than in a totally enclosed  
10 manner, as well the continued use of "PCB-Contaminated" materials. The Notice of  
11 Intent to Sue was sent to the Defendants and the EPA by certified mail, return  
12 receipt requested. A copy of the Notice, without exhibits, is attached hereto as  
13 Exhibit A. The receipts which were returned to Plaintiffs evidence that the latest  
14 that any Defendant or the EPA received notice of Plaintiffs' intent to sue was  
15 January 20, 2015.

## 16 **FACTUAL BACKGROUND**

### 17 **A. Nature and Uses of PCBs**

18           33. Polychlorinated biphenyls (PCBs) belong to the family of man-made  
19 organic chemicals known as chlorinated hydrocarbons. PCBs were domestically  
20 manufactured from 1929 until their manufacture was banned by TSCA in 1976  
21 because of their toxicity. Due to their non-flammability, chemical stability, high  
22 boiling point, and electrical insulating properties, PCBs were used in hundreds of  
23 industrial and commercial applications including electrical, heat transfer, and  
24 hydraulic equipment; as plasticizers in paints, plastics, caulk, and rubber products;  
25 and in pigments, dyes, and carbonless copy paper.

26           34. PCBs do not readily break down in the environment, but persist for  
27 long periods. They volatilize from liquid and solid PCB-containing materials and  
28 cycle between air, water and soil.

1        35. Although PCBs were no longer manufactured or distributed after 1979,  
2 due to their persistent nature, materials containing PCBs remain widespread to this  
3 day. Materials such as caulk containing PCBs continue to have high levels of PCBs  
4 as long as 60 years after installation, and will continue to emit PCBs into the  
5 environment far into the future.

6        36. In schools built before 1980, PCBs can be found in caulk, window  
7 glazing, florescent lighting ballasts, paint, joint sealants, ceiling tile coatings and  
8 other building materials.

9        37. The PCBs used in these products are chemical mixtures made up of a  
10 variety of individual chlorinated biphenyl components, known as congeners.  
11 Aroclor is a trade name for common commercial mixtures of PCB congeners which  
12 were manufactured by Monsanto in the United States, and is the type of PCB  
13 product found in the Malibu Schools.

14        38. PCBs in one material, for example, caulk, volatilize into the air and are  
15 absorbed by surrounding materials, causing wood, brick, concrete and other building  
16 materials to become contaminated with PCBs. These secondary sources of PCBs  
17 can also volatilize and contaminate the air, dust, and other materials in the building.  
18 PCBs in buildings can also volatilize and be deposited into and contaminate  
19 surrounding soil.

20        39. Exposure to PCBs can occur through inhalation, ingestion and dermal  
21 contact with PCB-contaminated building materials, air, dust and soil.

22        40. Caulk and other building materials containing PCBs were used in  
23 schools mainly between 1950 and 1979.

#### 24        **B. Health Effects of PCBs**

25        41. According to EPA, PCBs are probable human carcinogens, and cause  
26 adverse effects on the immune, reproductive, nervous and endocrine systems. EPA,  
27 "Health Effects of PCBs," available at [http://www.epa.gov/wastes/hazard/tsd/pcbs/](http://www.epa.gov/wastes/hazard/tsd/pcbs/pubs/effects.htm#Other)  
28 [pubs/effects.htm#Other](http://www.epa.gov/wastes/hazard/tsd/pcbs/pubs/effects.htm#Other).

1           42. In 2013, the International Agency for Research on Cancer (IARC)  
2 reassessed the carcinogenicity of PCBs. The Working Group, composed of 26  
3 experts from 12 countries, considered more than 70 independent epidemiological  
4 studies. The Working Group classified PCBs as “known human carcinogens” on the  
5 basis of sufficient evidence of carcinogenicity to humans and experimental animals.

6           43. Exposure to PCBs can cause liver toxicity, immunotoxicity,  
7 neurotoxicity, reproductive toxicity (including birth defects), developmental  
8 toxicity, endocrine disruption, disrupted insulin function, and changes in thyroid and  
9 steroid hormones.

10           44. PCBs are a risk factor for autism and attention deficit-hyperactivity  
11 disorder and impaired cognitive function.

12           45. A high level of PCBs in humans is also a risk factor for heart disease,  
13 hypertension and diabetes.

14           46. Exposure to PCBs is also a risk factor for asthma and respiratory  
15 diseases.

16           47. PCBs accumulate in the human body (bioaccumulate) and remain in  
17 the body for many years after exposure.

18           48. PCB congener 126 is a dioxin-like chemical which is highly stable and  
19 resistant to biodegradation, and the most toxic of all of the PCB congeners.

20 According to EPA’s Regional Screening Levels, which attempt to compute PCB  
21 concentration levels protective of human health, PCB 126 is orders of magnitude  
22 more toxic than other PCB congeners and PCB commercial mixtures (Aroclors).

23           49. PCBs are one of only 17 chemicals slated for elimination  
24 internationally by the Stockholm Convention on Persistent Organic Pollutants,  
25 ratified by 150 countries and entered into force in 2004.

26           **C. History of PCBs at the Malibu Schools**

27           50. In 2009 and 2010, the District conducted environmental reviews in  
28 connection with planned improvements on the Malibu High School campus. As part

1 of these reviews, ARCADIS (the District's environmental consultant) reported to  
2 the District that the soil in the Middle School Quad (located on the MHS campus)  
3 was contaminated with PCBs at over 11 times the California Human Health  
4 Screening Levels established by the California Environmental Protection Agency, as  
5 well as with pesticides and other toxins.

6 51. In 2010, ARCADIS concluded that the PCBs and pesticides in the soil  
7 posed an "unacceptable health risk" and proposed a removal action plan. "Removal  
8 Action Workplan Malibu Middle and High School Campus Improvements Project,"  
9 available at [http://fip.smmusd.org/downloads/MalibuMHS\\_Removal.pdf](http://fip.smmusd.org/downloads/MalibuMHS_Removal.pdf)

10 52. This plan was carried out during the summer of 2011, while summer  
11 school was in session. The District removed 48 truckloads of soil (1,179 cubic yards  
12 weighing 1,158 tons) from the Middle School Quad, which, unbeknownst to parents  
13 and teachers at the time, was contaminated with PCBs and pesticides.

14 53. Neither ARCADIS nor the District attempted to determine the source  
15 of the PCBs in the soil, or to test building materials to determine if they also  
16 contained PCBs which may have migrated to nearby soils.

17 54. In the two year period following the soil removal, three teachers then  
18 working at the MHS campus were diagnosed with thyroid cancer - a disease with an  
19 expected annual incidence of 1.29 per 10,000 Americans. As of today, at least three  
20 student alumni have also been diagnosed with thyroid cancer. There are also at least  
21 14 known cases of thyroid disease among teachers, and three cases of melanoma or  
22 pre-melanoma (a cancer which is also associated with exposure to PCBs) among  
23 teachers and former teachers, as well as other serious health problems.

24 55. In October 2013, several teachers wrote to the District with concerns  
25 that medical conditions they suffered may have been caused by the school  
26 environment. They pointed to three diagnoses of thyroid cancer among them within  
27 the preceding six months, several other cases of thyroid disease, and cases of  
28

1 migraines, rashes, hair loss, respiratory problems and bladder cancer. The teachers  
2 asked for environmental testing and for access to testing that had already occurred.

3 56. Following the public revelation of these medical issues among teachers  
4 and of the 2011 removal of toxic soil, in October 2013 a group of Malibu parents  
5 hired a local environmental scientist to advocate for immediate testing of all of the  
6 school rooms as well comprehensive soil testing. Although no comprehensive soil  
7 testing was performed at that time, at the parents' insistence some of the school  
8 rooms were tested.

9 57. Also around that time, some of the classrooms in which teachers had  
10 reported illnesses were vacated and those teachers and their students were sent to  
11 other classrooms or facilities.

12 58. The District employed Mark Katchen, with the Phylmar Group, to  
13 conduct testing.

14 59. In the initial testing in November 2013, ten rooms were tested for  
15 PCBs in caulk and interior wall paint ("bulk samples"). These rooms were: the  
16 Library (in the "Great White Building"); Rooms 1, 2, 5, 8 and 9 in the "Blue  
17 Building" or Building E; Room 301 in the "Thresher Building," or Building F; and  
18 Rooms 103, 104 and 105 in the Mako Building. Building E is primarily a middle  
19 school building; the Library, Building F, the Thresher Building and the Mako  
20 Building are used for both middle school and high school classes.

21 60. An Environmental Task Force formed by the District including parents  
22 and teachers selected these rooms because of their proximity to where PCBs had  
23 been found in the soil by ARCADIS. The intent was to test the hypothesis that  
24 building materials were the source of the PCBs in the soil. The test results appeared  
25 to confirm this hypothesis.

26 61. The Phylmar Group originally calculated a Malibu-specific screening  
27 level for cancer from PCBs in indoor air in order to reach a one in one million risk  
28 level (*i.e.* there would be one excess cancer out of a million people exposed to PCBs

1 at this level for the amount of time students and teachers spend in classrooms) of  
2 20.2 nanograms (ng) per cubic meter for staff and 63.7 ng per cubic meter for  
3 students. (The level for staff was lower because they spend more time in the  
4 classrooms). The Task Force agreed to use 20.2 ng as an action-level threshold for  
5 the Malibu Schools.

6 62. However, after receiving some test results of PCBs higher than 20.2 ng  
7 per cubic meter of air, the District unilaterally changed the screening level to 100 ng  
8 without any input or agreement from the Task Force. Months later, on January 27,  
9 2014, EPA changed the threshold to use 200 ng per cubic meter as a health guideline  
10 for indoor air at the Malibu Schools. EPA's suggested threshold was based on a  
11 calculation for a school in New York City with significantly different conditions  
12 from those in Malibu.

13 63. All of the caulk and paint samples from these rooms contained some  
14 level of PCBs. Four of the ten tested rooms had caulk samples with levels above the  
15 regulatory threshold of 50 ppm. The rooms testing above the regulatory limit were  
16 Rooms 1, 5 and 8 in Building E ("Blue Building") and the Library.

17 64. Out of 30 wipe (surface) samples in the ten tested rooms, all had some  
18 level of PCBs detected. Four wipe samples had PCBs at levels deemed "PCB  
19 Contaminated" under the PCB Regulations, *i.e.* above 10 micrograms per 100  
20 square centimeters. These samples all came from window sills in Rooms 1 and 5 in  
21 Building E ("Blue Building"), Room 301 (Thresher Building) and the Library. All  
22 of these rooms with the exception of Room 301 also had levels of PCBs in caulk  
23 exceeding the regulatory limit of 50 ppm.

24 65. In addition, air samples from the same ten rooms were tested for PCBs.  
25 All of the air samples showed some level of PCBs well above outdoor background  
26 levels. The highest level in these ten rooms was close to 100 ng of PCBs per cubic  
27 meter of air.

28

1           66. The initial samples were tested for all 209 PCB congeners. Most wipe  
2 and bulk samples and many air samples contained PCB 126, the most highly toxic  
3 of the PCB congeners.

4           67. The three teachers with thyroid cancer all taught in classrooms with  
5 toxic illegal levels of PCB in caulk or with wipe samples considered "PCB  
6 Contaminated" under the PCB Regulations.

7           68. On November 21, 2013, Steve Armann of EPA Region 9's PCB  
8 program wrote to Defendant Sandra Lyon, Superintendent of the District, informing  
9 the District that a PCB clean-up plan would be required which included "Removal  
10 and disposal of caulk material and any other source(s) of PCBs present at the  
11 school."

12           69. The initial test results indicated that there was some source of PCBs in  
13 all of the ten tested rooms in four different buildings in MHS, which was causing  
14 PCBs to be found in all of the air and wipe samples at well above background  
15 levels. Levels in caulk above regulatory thresholds were found in five out of ten  
16 tested rooms (four with over 50 ppm in caulk and one with over 10 ug per 100 cm<sup>2</sup>  
17 in a wipe sample). All these results indicated the likelihood of widespread  
18 violations of TSCA throughout the Malibu Schools. However, the District has since  
19 steadfastly refused to test any more caulk or other building materials in the Malibu  
20 Schools to determine the scope and extent of contamination requiring remediation  
21 under TSCA.

22           70. Instead, since December 2013, the District has tested only air and dust  
23 in selected rooms throughout the Malibu Schools. It is impossible to determine  
24 from air and dust tests whether PCBs in caulk or other materials exceed the  
25 regulatory threshold of 50 ppm or greater than 10 ug per 100 cm<sup>2</sup>. However, the  
26 initial tests of building materials, as well as later independent testing, indicate that  
27 illegal PCBs are found throughout the Malibu Schools; in some cases at many times  
28 the levels found in the initial testing.

1        71. The District's testing of air and dust revealing the presence of PCBs in  
2 many rooms evidences that there is a source of PCBs in those rooms which could be  
3 above TSCA limits, and in fact is highly likely to be above TSCA limits where the  
4 same type of caulk in the same building tested above legal limits.

5        72. In December 2013, the District conducted cleaning and pre-and post-  
6 cleaning air and wipe testing in 21 classrooms, including the ten tested previously.  
7 These rooms were in the Building E ("Blue Building"), Building F ("Thresher  
8 Building"), the Great White Building where the Library is located, the Mako  
9 Building, and a faculty office located near the boys' locker room for the gym, which  
10 is used by both the Middle and High Schools. Despite the fact that the District's  
11 consultant left the windows open in several of the tested rooms, thus diluting the  
12 PCBs in the samples, all of the tested rooms showed some level of PCBs in the air  
13 significantly in excess of outdoor levels, as well as PCBs in all of the wipe samples,  
14 both pre- and post-cleaning, indicating that there is a source of PCBs in all of these  
15 21 rooms in five different buildings in MHS.

16        73. In February 2014, the District retained the firm Environ International  
17 (Environ) as its consultant on chemical contamination issues in the Malibu Schools.

18        74. On April 25, 2014, Environ submitted to EPA its draft  
19 "Comprehensive PCB-Related Building Materials Inspection, Management and  
20 Removal Plan for the Santa Monica-Malibu Unified School District" (hereinafter  
21 "First Environ Plan") In that Plan, Environ, on behalf of the District, proposed to  
22 remove caulk determined to contain PCBs in concentrations above the regulatory  
23 standard of 50 ppm in the Library and rooms 1, 5 and 8 only in connection with the  
24 demolition or renovation of the buildings in which those rooms are located, even  
25 though no such demolitions or renovations were then scheduled. Environ, again on  
26 behalf of the District, proposed to "manage in place" those PCBs and other  
27 suspected PCB-containing materials in the interim. Management in place would  
28

1 consist of general school cleaning and repair or removal only of visibly deteriorating  
2 caulk.

3       75. The First Environ Plan provided for sampling of building materials  
4 and soils to determine the nature and extent of the presence of PCBs, but only  
5 immediately prior to any renovation or demolition the District might conduct at an  
6 unknown time in the future. If such sampling prior to renovation or demolition  
7 revealed PCBs in excess of regulatory limits, then a site-specific remediation plan  
8 would be created at that time to govern removal and appropriate disposal of PCB-  
9 containing materials from the buildings about to be renovated or demolished. The  
10 First Environ Plan did not provide for any testing of building materials, air, or dust  
11 during the “manage in place” period prior to renovation or demolition.

12       76. On June 4, 2014, EPA rejected the First Environ Plan. EPA asked for  
13 the submission within 30 days of two separate plans – one for Malibu High School  
14 and one for schools District-wide. EPA demanded a schedule to actually remove  
15 caulk containing 50 ppm or greater concentrations of PCBs, and asked for the  
16 addition to the plan of periodic air and wipe testing pending removal.

17       77. On July 3, 2014, Environ submitted on behalf of the District its “Site-  
18 Specific, PCB-Related Building Materials Management, Characterization and  
19 Remediation Plan” for the Library and Building E rooms 1, 5 and 8” (hereinafter  
20 “Second Environ Plan.”) Despite EPA’s demand for a schedule to actually remove  
21 illegal PCBs, the Second Environ Plan continued the proposal in the First Environ  
22 Plan to remove and dispose of the illegal caulk and other building materials only  
23 when renovations or demolitions of the buildings occurred at an unknown time in  
24 the future. The Second Environ Plan merely added a provision that removal would  
25 occur within 15 years, if that were sooner than renovation or demolition, with the  
26 possibility of requesting an extension of the 15-year timeframe.

27       78. The Second Environ Plan provided for no further testing of caulk or  
28 other materials, except in conjunction with building renovation or demolition, or in

1 conjunction with caulk removal when more than 15 years had elapsed without  
2 renovation or demolition.

3 79. Prior to such future removal of caulk and other contaminated  
4 materials, management in place would take place through cleaning (as with the First  
5 Environ Plan), with the addition of air and wipe sampling in selected rooms over a  
6 one year period. EPA has never approved or disapproved the Second Environ Plan.

7 80. On July 17, 2014 Plaintiffs PEER and America Unites (then Malibu  
8 Unites) submitted comments on the Second Environ Plan, asserting that the Plan  
9 was in violation of TSCA and of EPA's specific directions for the Plan. Along with  
10 their comments, PEER and Malibu Unites submitted results from independent  
11 testing for PCBs from an EPA-certified laboratory. (First Set of Independent Tests).  
12 The first room to be tested in JCES, Room 19, Building F, had 340,000 ppm PCBs  
13 in the caulk, thousands of times higher than the highest level of 1,870 ppm  
14 previously found in the Library and nearly seven thousand times the regulatory limit  
15 of 50 ppm. The woodshop room in the High School Angel Building had caulk in  
16 the door frame which tested even higher – at 370,000 ppm PCBs.

17 81. Ironically, Room 19 in JCES was one to which a sixth grade teacher  
18 and her students had been moved during the previous school year to protect them  
19 from exposures in a Middle School room which contained caulk only modestly  
20 above the 50 ppm legal threshold. The District had touted its "protective" action  
21 which in fact moved this teacher and students to a then-untested room with  
22 thousands of times more PCBs.

23 82. The independent testing also showed that caulk in the office near the  
24 boys' locker room in MHS exceeded regulatory standards at 190 ppm, and dirt  
25 samples showed PCB levels as much as 11 times higher than EPA's regional  
26 screening guide in MHS Rooms 1, 2 and 5 in Building E (the Blue Building).  
27  
28

1        83. In sum, the First Set of Independent Tests found three rooms with  
2 caulk exceeding legal limits, with two of them in the hundreds of thousands ppm  
3 PCBs.

4        84. PCBs above regulatory limits had now been found in four different  
5 buildings at all three Malibu Schools – the Elementary, Middle and High Schools.

6        85. Over the summer of 2014, Environ carried out its plans to clean and  
7 test air and dust in many of the rooms at the Malibu Schools. No caulk or other  
8 building materials (bulk samples) were tested.

9        86. Unlike the earlier testing by the Phylmar Group, Environ did not test  
10 all of the PCB congeners, but only total PCBs. Also, Environ used a detection level  
11 of approximately 70 ng per cubic meter for air tests, thus producing numerous “non-  
12 detect” results which do not in fact indicate that there were no PCBs in the air. The  
13 earlier testing was able to detect PCBs in outdoor air at 1.23 ng per cubic meter. Its  
14 lowest detection in indoor air was around 3 ng per cubic meter.

15        87. As noted above, the earlier testing found PCBs in indoor air above  
16 outdoor background levels in all tested rooms, indicating a source of PCBs in those  
17 rooms. The Environ testing avoided such findings by setting the detection level  
18 much higher. Environ’s detection level of 70 ng per cubic meter was not far below  
19 EPA’s health guideline of 100 ng per cubic meter for children ages 3 to 6. As noted  
20 above, EPA has cautioned that it suggested health guidelines for PCBs in air should  
21 be used with “an appreciation of the uncertainty surrounding the estimates.”

22        88. While Environ claimed to “clear” for occupation all of the Malibu  
23 School buildings based on its air and dust sampling, its findings did not determine  
24 whether or not there were regulatory exceedances in the rooms tested. For example,  
25 Room 19 at JCES, which had 340,000 ppm total PCBs in caulk and 122 ppm PCB  
26 126, more than two million times above the EPA health screening guideline, was  
27 cleared for occupancy by elementary school children. Because Environ did not test  
28

1 for individual PCB congeners, it is not known how much of the PCBs which were  
2 detected in the air of Room 19 were PCB 126.

3 89. When rooms tested above EPA guidelines for PCBs in air and dust,  
4 Environ simply re-cleaned the rooms until a reading below the EPA guidelines  
5 could be obtained. In two rooms, the woodshop room in MHS and an office at  
6 JCES, this did not succeed, and those rooms were closed off, though rooms all  
7 around them, likely built with the same caulk and other building materials, remained  
8 open regardless of whether they had been tested in any form.

9 90. In a December 2014 Report on its sampling and cleaning efforts over  
10 the summer of 2014, Environ reported that it had tested air and dust in 30 to 60% of  
11 regularly occupied rooms either pre- or post-cleaning. It stated that the tested rooms  
12 were expected to be representative of the non-sampled regularly occupied rooms  
13 because they had the same construction history, similar potentially PCB-impacted  
14 building materials and similar functions and usage patterns. Thus, Environ  
15 concluded that conditions in the rooms not tested were not expected to be different  
16 from those that were tested.

17 91. The same reasoning would apply to rooms where caulk was tested and  
18 found to be above legal limits; the same results should be expected in other rooms  
19 with the same construction history and similar PCB-impacted building materials,  
20 *e.g.* caulk.

21 92. In many cases, the cleaning conducted by Environ for the District over  
22 the summer of 2014 actually increased the levels of PCBs in the air. Cleaning  
23 decreased PCB air concentrations only in a small percentage of cases. Environ  
24 reported that 21% of air samples collected at the same location both pre- and post-  
25 cleaning had increased levels of PCBs after cleaning, 67% remained the same, and  
26 only 12% decreased.

1        93. Environ reported that the levels of PCBs in dust samples increased  
2 post-cleaning in 5% of the samples, decreased in 26% of the samples and 68%  
3 stayed non-detect.

4        94. Thus, the “best management practices” cleaning conducted by the  
5 District actually causes PCBs in the air to increase or stay the same most of the time,  
6 while removing dust succeeds in reducing PCB levels in dust more often than it  
7 raises those levels, although it is not known how temporary the improvement is, *i.e.*  
8 how soon PCB-laden dust is redeposited.

9        95. Based on repeated testing in other schools such as those in New York  
10 City, it has been shown that air and dust levels of PCBs are highly variable over  
11 even short periods of time – any particular test only gives a snapshot that could  
12 change substantially from day to day.

13        96. In Environ’s testing over the summer of 2014, an area of soil near the  
14 woodshop room also exceeded regulatory standards for PCBs in soil. It was fenced  
15 off and a soil removal action subsequently took place under the supervision of the  
16 California Department of Toxic Substances Control. The source of PCBs in that soil  
17 was not determined; however the nearby woodshop room had the highest level of  
18 PCBs in caulk found in the independent tests discussed above.

19        97. On August 12, 2014, Plaintiff America Unites submitted to the District  
20 a Memorandum containing “Recommendations for PCB Investigation at Malibu  
21 Middle & High” which contained a plan for thorough testing and remediation  
22 throughout the Malibu Schools. This plan was never acknowledged or followed.

23        98. Also on August 12, 2014 at a public gathering, Cindy Crawford and  
24 her husband, who were MHS parents, offered to pay for full testing of all of the  
25 caulk at the Malibu Schools. The District did not accept their offer.

26        99. When school re-opened in late August 2014, teachers were threatened  
27 with firing if they did not re-occupy rooms in which caulk or wipe samples had  
28 tested above regulatory limits.

1        100. A first grade student whose parents did not want her to attend specialty  
2 classes in a room in Building F of JCES which had tested with extremely high levels  
3 of PCBs in caulk was threatened with truancy.

4        101. Although EPA had neither approved nor disapproved the Second  
5 Environ Plan to leave PCBs in violation of TSCA in place for 15 years or more, on  
6 August 14, 2014, a District official sent an email to an EPA Region 9 PCB official  
7 stating that the District would remedy the TSCA violations identified at “four  
8 window areas” by June 30, 2015. The District official stated that this was a  
9 “voluntary corrective agreement.” The email also stated: “Additionally should we  
10 find additional TSCA regulated materials, we anticipate voluntary removal of those  
11 materials and will coordinate with the EPA regarding any necessary approvals and  
12 timing.” However, the District did not reference or agree to remove the caulk that  
13 had already been found to be in violation of TSCA in independent tests in additional  
14 rooms; nor did it provide any plans to “find additional TSCA regulated materials.”

15        102. Also on August 14, 2014, EPA Region 9 Administrator Jared  
16 Blumenthal wrote a letter to Sandra Lyon, Superintendent of the District. The letter  
17 “acknowledge[d] the District’s plan to remove the caulk” from four windows by  
18 June 30, 2015. The letter also stated that “EPA concurs with this approach,” and  
19 that EPA did not recommend “additional testing of caulk unless dust or air samples  
20 persistently fail to meet EPA’s health-based guidelines.” The letter did not address  
21 the extremely high levels of PCBs, up to thousands of times the legal limit, that had  
22 been identified in independent testing, or that many other rooms where caulk had  
23 not been tested were likely to exceed legal limits based on the fact that rooms in the  
24 same building, likely built with the same caulk, had exceedances.

25        103. In September 2014, additional independent test results from an EPA-  
26 certified laboratory were submitted to EPA and the District. (Second Set of  
27 Independent Tests). Four additional rooms in MHS where caulk had not been  
28

1 previously tested were found to exceed regulatory limits, with two of these in the  
2 hundreds of thousands of ppm PCBs.

3 -- Room 401 in the Leopard Building had 146,000 ppm PCBs.

4 -- Room 505 in the Angel Building had 231,000 ppm PCBs.

5 -- Room 205 in the Mako Building had 200 ppm PCBs

6 -- Room 7 in Building E (Blue Building) had 190 ppm.

7 104. The Second Set of Independent Tests also included a piece of caulk  
8 which was retrieved from a walkway on the MHS campus after it fell out of a trash  
9 bag being hauled by a worker towards the High School parking lot to a car labeled  
10 "air duct cleaning." This was apparently part of a surreptitious caulk removal effort  
11 which was not reported to the community or to EPA to ensure compliance with  
12 protective practices and disposal regulations. This caulk also tested above the legal  
13 limit at 58 ppm.

14 105. At this point, every building on the MHS campus (six buildings) and  
15 the only building on the JCES campus where caulk had been tested had exceedances  
16 of the regulatory limit, indicating the likelihood that many more as yet untested  
17 rooms in all of the pre-1980 school buildings have regulatory exceedances.

18 106. On September 26, 2014, Environ submitted by email a letter to EPA  
19 Region 9 PCB official Steve Armann on behalf of the District regarding  
20 "Supplemental Removal Information for the Library, Building E – Rooms 1, 5 and  
21 8, and Building G, Room 506 at Malibu High School" (hereinafter "Environ  
22 Supplement"). The letter stated that it was intended to supplement and modify the  
23 Second Environ Plan. The document clarified that the four window areas referenced  
24 in the District's August 14, 2014 email as having TSCA violations were four  
25 windows in the Library, and Rooms 1, 5 and 8. It also stated the District's intention  
26 to implement a similar remedy for the interior doorframes in the woodshop room,  
27 Room 506. (Room 506 was the room identified in independent testing as having  
28 370,000 ppm PCBs in the caulk in the interior door frame, though Environ's letter

1 did not acknowledge this). The letter noted that wipe samples from the doorframe  
 2 exceeded the regulatory standard of 10 ug per hundred cm<sup>2</sup> even after repairs and  
 3 additional cleaning.

4 107. The Environ Supplement stated the District's current intention to  
 5 physically remove and replace caulk only from the four window units and one  
 6 doorframe. It did not extend even to caulk in other windows and doors in the same  
 7 rooms. However, the letter also committed to the same procedures for other  
 8 buildings in the District where 50 ppm or greater PCBs are "identified and verified  
 9 in building materials," within one year of identification and verification. However,  
 10 the Supplement did not acknowledge or address the findings in the independent tests  
 11 of caulk exceeding legal limits.

12 108. In October 2014, America Unites asked the laboratory to re-run the  
 13 caulk from the two rooms with the highest PCB concentrations (JCES Room 19 and  
 14 the High School woodshop room) for all of the PCB congeners, and then  
 15 specifically for congener 126, the most toxic of all of the PCB congeners. The  
 16 samples had previously been analyzed only for total PCBs. These new tests found  
 17 the presence of congener 126 at 122 ppm in Juan Cabrillo Room 19 and 57 ppm in  
 18 the woodshop – up to more than three million times more toxic than the EPA health-  
 19 based Regional Screening Level which provides for PCB 126 concentrations in the  
 20 low parts per *trillion* to provide an acceptable level of cancer risk.

21 109. In December 2014, additional test results were received by America  
 22 Unites and submitted to EPA and the District showing regulatory exceedances in  
 23 four more rooms in JCE and two more rooms in the MHS. (Third Set of  
 24 Independent Tests). These results were also resubmitted to the Defendants with the  
 25 Notice of Intent to Sue on January 12, 2015.

26 ■ MHS Room 704 had 4,700 ppm PCBs in caulk an a door frame in a  
 27 hallway

28 ■ JCES Room 22 had 74,000 ppm PCBs in interior window caulk

- 1 ■ JCES Room 18 had 110,000 ppm PCBs in interior window caulk
- 2 ■ A JCES office had 710 ppm PCBs in interior window caulk
- 3 ■ JCES Room 23 had 17,000 ppm PCBs in interior window caulk

4 110. Neither EPA, nor the District, nor its contractor Environ ever  
5 responded to the submission of the three sets of independent test results or created a  
6 plan to remediate these thirteen additional rooms, six of which had extremely high  
7 levels of PCBs in caulk -- four in the hundreds of thousands of ppm, and two in the  
8 tens of thousands ppm.

9 111. At the present time, there are known to be 17 rooms in six different  
10 buildings in MHS and two different buildings in JCES with PCBs in caulk above 50  
11 ppm.

12 112. On October 6, 2014, Plaintiffs PEER and Malibu Unites wrote to  
13 Superintendent Lyon asking for clarification of the September 26, 2014 Environ  
14 Supplement. Specifically, Plaintiffs asked "what information the District needs to  
15 'identify and verify' the presence of PCBs above TSCA limits," and whether the  
16 District would accept and act upon the independent test results that showed at least  
17 twelve additional rooms with caulk above TSCA limits. The letter also requested  
18 that if those independent test results were considered deficient, the District specify  
19 with particularity in what manner they were deficient. Finally, the letter asked if the  
20 District would "accept and execute the [August 12, 2014] testing plan provided to  
21 them by Malibu Unites and Cindy Crawford to test all three schools? This plan takes  
22 one weekend to execute and 10 days to produce preliminary results. If not, please  
23 specify with particularity as to why the district will not identify and verify all PCB  
24 sources in the three schools." To date, Plaintiffs have received no response to this  
25 letter.

26 113. On October 31, 2014, EPA approved under 40 C.F.R. 761.61 only the  
27 portion of the Second Environ Plan and Environ Supplement regarding the PCBs  
28 remaining in the substrate (known as PCB Remediation Waste) after removal of

1 PCB-containing caulk in the four rooms slated for caulk removal by June 2015.  
2 EPA approved Environ's plan to seal and encapsulate porous substrates underneath  
3 the removed caulk and within one foot of it, and to decontaminate non-porous  
4 substrates with a solvent, until renovation or demolition occurs. The District is  
5 required to continue best management practices cleaning and periodic air and wipe  
6 samples for at least a year and to take further action if exceedances of EPA's health  
7 guidelines occur. Full remediation and disposal of the PCB Remediation Waste in  
8 accordance with the PCB Regulations would occur at the time of renovation or  
9 demolition.

10 114. Therefore, even with respect to materials in proximity to caulk testing  
11 in excess of regulatory limits, the District will not be identifying and removing  
12 materials in violation of TSCA prior to renovation or demolition at an unknown  
13 time in the future.

14 115. Over winter break in December 2014 and January 2015, Environ  
15 conducted additional air and dust sampling at the Malibu Schools. Again, no caulk  
16 or other building materials were tested.

17 116. As with its testing the previous summer, Environ did not test for the  
18 individual congeners of PCBs, and used a detection level of approximately 70 ng per  
19 cubic meter for air tests, thus producing numerous "non-detect" results which do not  
20 in fact indicate that there were no PCBs in the air.

21 117. Just before the winter break, from December 16-19, 2014, the  
22 SMMUSD sent in a "special crew" to clean and wipe down surfaces in the Malibu  
23 Schools. This special cleaning concluded just 24 hours prior to the beginning of  
24 Environ's testing of air and dust for PCBs, which took place between December 20  
25 and 29, 2014.

26 118. This special cleaning was intended to reduce the amount of PCBs in air  
27 and dust in the samples about to be collected, such that those samples would not  
28 accurately reflect the exposures that students and teachers actually experienced in

1 the time period since the last testing and cleaning the previous summer of 2014, and  
2 to make it appear that EPA's health guidelines for air and dust samples had been  
3 met, even if conditions prior to the special cleaning did not meet those guidelines.

4 119. Despite this pre-cleaning effort, two rooms had dust samples above  
5 EPA's threshold – the old gymnasium in MHS and Room 19 in JCES, the latter of  
6 which independent test results had shown to have extremely high levels in the caulk.  
7 (The old gymnasium had never had caulk tested, either by the District or  
8 independently).

9 120. The District then performed additional cleaning in these two rooms. In  
10 the case of JCES Room 19, four samples remained above EPA guidelines, and a  
11 second re-cleaning was done, finally obtaining results below the guidelines. The air  
12 in this room was not tested until after the second re-cleaning.

13 121. On January 12, 2015, Plaintiffs served the Notice of Intent to Sue in  
14 this case. Return receipts from certified mail evidence that Defendants received this  
15 Notice at the latest by January 20, 2015.

16 122. On February 27, 2015, the District sent an email message to the parents  
17 and staff of the Malibu Schools. The message stated, among other things, that the  
18 District had been made aware of third party sampling revealing the existence of  
19 caulk above the 50 ppm TSCA threshold. In fact, the District had been aware of  
20 independent testing showing extremely high illegal levels of PCBs for over seven  
21 months, since July 2014.

22 123. The District's February 27, 2015 email then claimed that it had not  
23 been able to confirm the exact locations where these samples were taken. However,  
24 the Plaintiffs had supplied the District with information identifying the rooms and  
25 locations where the samples were taken, and the District had reported in September  
26 2014 that it had sampled air and dust in some of the same rooms that were  
27 independently tested, specifically identifying those rooms, revealing that it in fact  
28 had no problem identifying the rooms where the independent samples were taken.

130. By continuing an unauthorized use and failing to remove and properly dispose of building materials with PCBs at or above 50 ppm or with surface concentrations above 10 ug per 100 cm<sup>2</sup> at the Malibu Schools, the Defendants have violated TSCA, 15 U.S.C. 2605(e)(2) and 15 USC §2614(1); and its implementing regulation at 40 CFR §761.20(a).

131. Plaintiffs are authorized to bring this action to restrain a violation of TSCA, and the Court is authorized to provide declaratory and injunctive relief by 15 U.S.C. § 2619.

### **PRAYER FOR RELIEF**

WHEREFORE, Plaintiffs respectfully request that this Court:

A. Declare that Defendants have violated TSCA by continuing the unauthorized use of and failing to remove building materials containing 50 ppm or more PCBs or which have surface concentrations of PCBs above 10 ug per 100 cm<sup>2</sup> from the Malibu Schools;

B. Issue preliminary and permanent injunctive relief requiring Defendants to (i) cease all use of caulk and other materials at the Malibu Schools containing PCBs at concentrations of 50 ppm or greater or having surface concentrations of PCBs above 10 ug per 100 cm<sup>2</sup>; (ii) comprehensively test all caulk and other building materials in the Malibu Schools for PCBs at concentrations over 50 ppm or surface concentrations of PCBs above 10 ug per 100 cm<sup>2</sup>; (iii) promptly remove all building materials containing 50 ppm or more PCBs or which have surface concentrations of PCBs above 10 ug per 100 cm<sup>2</sup> from the Malibu Schools; and (iv) dispose of such materials in accordance with the TSCA Regulations;

C. Award Plaintiffs costs, expert witness fees, testing costs, and attorneys' fees in accordance with 15 U.S.C. §2619(e); and

1 D. An award of any other relief the Court deems appropriate.
