# Executive Summary

This report describes the initial efforts to evaluate data from building radiation surveys performed by Tetra Tech EC, Inc. (TtEC) at the former Hunters Point Naval Shipyard (HPNS) from 2008 to 2016. The intent of the data evaluation is not to provide a complete review of the building radiation surveys, nor identify all instances of data manipulation and/or falsification. While the Navy selected four methods for the initial survey evaluation, additional inconsistencies and anomalies were noted but not investigated fully because the initial evaluation provided ample evidence that the building radiation surveys had been manipulated and could not be used to support a recommendation for unrestricted radiological release. The data evaluation performed by the Department of the Navy (Navy) determined that former worker allegations describing improper data collection and manipulation could be verified by developing and applying analytical methods on the TtEC -provided data and TtEC-submitted survey reports. Evidence of data manipulation and/or falsification was found in the building radiation surveys. It is concluded that some surveys have been falsified and additional data will need to be collected to support a recommendation for unrestricted radiological release at HPNS radiologically-impacted buildings.

Allegations regarding HPNS building survey methods and data are grouped into categories of scan speed, detector movement, and falsification. Four methods were developed to evaluate Navy-provided electronic survey data from 28 buildings and 816 survey units at HPNS. The Scan Speed and Coverage method calculated the average scan speed and the minimum area covered during conduct of alpha-beta radiation scanning. The method was applied to four survey units for verification, and the resulting rapid scan speeds (or low scan coverage) are expected to be consistent in nearly all survey units. The Data Distribution Comparison method was used as an indicator of whether the detectors were in motion or simply left in one place. The method was used on two data sets, and based on the inconclusive results, the method is not recommended to assess detector movement.

Two methods were developed to assess data falsification and manipulation. The first method, Data Duplication Query, used a query to identify 40 duplicated data strings in electronic data, ranging from 4 to 473 values in length. These duplicated data strings occurred in 15 of the 28 buildings, in 49 of the 816 survey units (6 percent), and in 10,075 of the 567,517 data points (3 percent) evaluated. In addition to data duplication, additional instances and types of data manipulation were identified. The second method, Sum of Statics Assessment, was developed to identify duplications in non-sequential sets of data. While the method was validated, no instances of duplicated results were identified by this method.

The methods developed and applied during the data evaluation described in this report represent the Navy's initial effort to demonstrate the ability to assess allegations of data manipulation, and to assist in making decisions on pending dispositions of the buildings at HPNS. The allegations regarding detector speed were successfully assessed using the Scan Speed and Coverage method. The detector movement allegation was evaluated using the Data Distribution Comparison method and determined to be inconclusive. The allegation of data falsification was supported by the Data Duplication Query method, which identified various means of data duplication and potential manipulation rather than the replacement of individual survey results. The Sum of Statics Assessment method was validated without identifying further instances of duplication. The overall conclusion of this initial building radiation survey evaluation is that the surveys have been falsified and cannot be used to support a recommendation for unrestricted radiological release for HPNS radiologically-impacted buildings.

SECTION 1

# Introduction

This report describes initial efforts to evaluate data from radiological surveys performed by Tetra Tech EC, Inc. (TtEC) in buildings at the former Hunters Point Naval Shipyard (HPNS) from 2008 to 2016. The data evaluation was performed by the Department of the Navy (Navy) to assess whether allegations made regarding improper data collection and manipulation could be verified. The evaluation process included developing and applying analytical methods on the provided electronic data.

Allegations regarding HPNS building survey data collection are grouped into categories of scan speed, detector movement, and falsification. The scan speed allegation was that the detector was moved too quickly during scanning in Class 1 survey units. The scan speed allegation was evaluated using the Scan Speed and Coverage method described in Section 4. The detector movement allegation was that the detector was moved slightly at the start of scanning in Class 2 or Class 3 survey units and then left in place without any movement for the remainder of data collection. The detector movement allegation was evaluated using the Data Distribution Comparison method described in Section 5. The falsification of data allegation was that collected data were substituted with other data after scans were completed, and that collected data were manipulated to remove high and low results. This allegation was evaluated using the Data Duplication Query method described in Section 6, and the Sum of Statics Assessment method described in Section 7.

The methods developed and applied during the data evaluation described in this report represent the Navy's initial effort to demonstrate the ability to assess allegations and to assist in making decisions on pending dispositions of buildings at HPNS. Because some types of data manipulation are difficult or impossible to identify, this report cannot verify that additional portions of the database have not been manipulated.

SECTION 2

# Data Preparation

TtEC survey data for this evaluation were provided in three electronic Microsoft Excel files:

1. *Alpha-Beta Scans and Statics.xlsx.* This file contains Alpha-Beta Scan (ABSC), Alpha-Beta Static (ABST) and Alpha-Beta Static Background (ABSTBKG) data dating from March 19, 2008 to August 19, 2016 and from record identification (ID) numbers 910 to 585820. These data appear to be from original alpha-beta surveys. If a resurvey (verification survey) was performed in a survey unit, in nearly all cases the original data are missing in this file (resulting in gaps in record ID numbers) and the new resurvey data recorded in the *Alpha-Beta Scans and Statics 2.xlsx* file.
2. *Alpha-Beta Scans and Statics 2.xlsx*. This file contains only ABSC data dating from November 23, 2013 to August 23, 2016, and from record ID numbers 1 to 801956. ABSC data for Buildings 211 and 253 were collected using ganged arrays of four detectors.
3. *Gamma Scans and Statics.xlsx*. This file contains Gamma Scan (GSC), Gamma Static (GST), and Gamma Static Background (GSTBKG) data dating from March 13, 2008 to March 17, 2016 and from record ID numbers 210 to 488132.

The two Alpha-Beta files were combined into a single Excel workbook to enable evaluation of all data of the same type (Alpha-Beta). To avoid any overlap in the ID numbers from the original files, a *Combined ID* column was added with a new, sequentially assigned number for each row. As an example of the alpha-beta worksheet, Figure 2-1 includes the Combined ID, table number from which the data originated, building, survey unit, location (F=floor, W=wall, C=ceiling), survey date and time, and alpha and beta count-per-minute (cpm) results. Because the data from gamma scanning and static measurements are several times higher than either alpha or beta data, that file was evaluated as provided and not compared to the alpha-beta data. In some cases, comparisons were made to data, or data were extracted from Final Status Survey Reports (FSSRs) submitted to the Navy for each building.

SECTION 3

# Applicable Buildings

TtEC survey data collected in the following impacted buildings were selected by the Navy for evaluation using the methods described in this report:

- Parcel A – Building 322
- Parcel B – Buildings 103, 113, 113A, 130, 140, 146, and 157
- Parcel C – Buildings 203, 211, 214, 224, 241, 253, 271, and 272
- Parcel E – Buildings 406, 414, 521, and 810
- Parcel D-2 – Building 813
- Parcel G – Buildings 351, 351A, 365, 366, 401, 411, and 439
- Parcel UC-1 – Building 819

The former Building 322 had no data in either the alpha-beta or gamma databases and was, therefore, excluded from further evaluation. As a result, the survey data for a total of 28 buildings were evaluated.

SECTION 4

# Scan Speed and Coverage Method

## 4.1 Overview

The Scan Speed and Coverage method was developed to evaluate scanning data with respect to the allegation that the survey instrumentation was moved faster than the rate specified in the building Task-specific Plans (TSPs). Radiation detection instrumentation used to scan surfaces typically takes measurements at a fixed-time interval while the detection system is in motion. Most often, the system is handheld or cart-mounted. Handheld systems are either moved side to side or swung back and forth as a pendulum during scanning, with the latter producing a serpentine pattern as the surveyor walks forward. Cart-mounted systems are common and are pushed by the surveyor in pre-established patterns to cover the survey unit area with sufficient density. The measurement results are recorded by a data logger for download and may include alpha cpm and beta cpm, collected simultaneously as a data pair, as shown on Figure 4-1, from floor scanning in Building 113, Survey Unit 3. The duration of scanning and the number of data points collected during that time are then used, along with the size of the detector and survey unit, to determine the average speed at which the detector was scanning or the amount of the survey unit that was scanned.

Figure 4-1. ABSC Data Output for Building 113, Survey Unit 3, Floors

The survey protocols in the TSP for each building for Class 1 survey units included scanning 100 percent of accessible surfaces at a predetermined scan rate. The design scan rate defined in the TSP for each building (1.37 centimeters per second [cm/s]) was set such that the detector moved one detector depth (15.9 centimeters [cm]) in each scan interval (11.6 seconds [s]). Using the total scan duration and the area of the survey unit, two methods can be employed to validate that the surveys were implemented as designed:

1. If 100 percent of a survey unit's area will be scanned, the average survey scan rate is the linear distance traveled by the detector (cm) during the total scan duration (s). This scan speed calculation is described in Section 4.2.
2. If the detector is moved at the design scan rate, the maximum amount of survey unit area scanned is the area covered by the detector (in square meters [$m^2$]) during the total scan duration over the survey unit area ($m^2$). This scan coverage calculation is described in Section 4.3.

# 4.2 Scan Speed Calculation Method

Calculation of the average scan speed used during a survey uses the survey scanning duration, the physical dimensions of the detector, and the survey unit area. The method will be illustrated using Building 113, Survey Unit 3, as an example.

From Figure 4-1 and Figure 4-2, the survey unit classification (Class 1) and size (69.77 $m^2$), the detection system ID (067), and serial number (234870) are noted. The 69.77 $m^2$ is the floor area only, so only floor scan durations will be used. This was the only system used for ABSC measurements in this survey unit, and from the instrument calibration sheet (Figure 4-3), it is identified as a Ludlum Model 43-37-1 detector, which is known to be 15.9 cm deep (in the direction of travel) by 64.1 cm wide.

Figure 4-3. Instrument Calibration Certificate for ABSC Measurements in Building 113, Survey Unit 3, Floors

The following steps were used to determine the average scan speed during the survey of Building 113, Survey Unit 3 floors:

- The design scan rate from the TSP is the detector depth divided by the scan interval:

$$\textit{Design scan rate} = 15.9\ \text{cm}/11.61\ \text{s} = 1.37\ \text{cm/s}$$

- Scans of the floor were completed between 9:38:50 and 10:42:31 a.m. without breaks, for a total scan duration of 3,821 s.
- The linear distance traveled by the detector is the floor area divided by the detector width:

$$\textit{Linear distance (cm)} = 69.77\ \text{m}^2 \times (10{,}000\ \text{cm}^2/\text{m}^2)/64.1\ \text{cm} = 10{,}885\ \text{cm}$$

- The average survey scan rate is the linear distance traveled by the detector divided by the scan duration:

$$\textit{Survey scan rate} = 10{,}885\ \text{cm}/3{,}821\ \text{s} = 2.85\ \text{cm/s}$$

From these results, if the entire floor area was scanned (100 percent scan coverage) during the scan duration, then the detector must have been moving an average of 2.85 cm/s, which is more than twice the design scan rate. Also, the design scan rate is 48 percent of the calculated average scan rate.

## 4.3 Scan Coverage Calculation Method

Calculation of the maximum area scanned during the survey (scan coverage) uses the scan interval, total data points collected during the survey, the physical area of the detector, and the survey unit area. The method is illustrated using Building 113, Survey Unit 3, as an example:

- The scan interval of 11.61 s is the time between results, such that one result is recorded every 11.61s.
- During the total scan duration, 326 data points were recorded.
- Because the scan rate defined in the TSP indicated that the detector moves one detector depth in each scan time interval, the area scanned during the scan duration is the number of data points times the physical area of the detector:

$$\textit{Area scanned}\ (\text{m}^2) = 326\ \text{points} \times (15.9\ \text{cm} \times 64.1\ \text{cm})/\text{point} \times (\text{m}^2/10{,}000\ \text{cm}^2) = 33.23\ \text{m}^2$$

- The survey scan coverage is the area scanned divided by the survey unit area:

$$\textit{Survey scan coverage} = 33.23\ \text{m}^2/69.77\ \text{m}^2 = 48\%$$

From these results, if the floor area was scanned at 1.37 cm/s, then the data points recorded during the scan duration provide a maximum of 48 percent scan coverage, which is less than half the design scan coverage.

## 4.4 Scan Speed and Coverage Results

The methods used to calculate average scan speed and maximum scan coverage are related. For a given survey unit, only one method is required depending on what information is known or assumed and based on the objective of the evaluation. If we know or assume that the entire survey unit was scanned, then the average scan speed can be calculated. If we know or assume the average detector scan speed, then the maximum scan coverage can be calculated.

Scan speeds and scan coverages were calculated for four survey units to demonstrate and validate the methodology (Survey Unit 3 is one of the four survey units; Survey Unit 3 calculations are presented in Sections 4.2 and 4.3 as an example).

SECTION 5

# Data Distribution Comparison Method

## 5.1 Overview

The Data Distribution Comparison method was developed to evaluate scanning data with respect to the allegation that the survey instrumentation was not in motion during parts of surveys in Class 2 or Class 3 survey units. The method compares the distribution of data from initial surveys to that of later resurveys, or verification surveys, in the same locations. TtEC or the Navy identified that the scanning speeds for some alpha-beta surveys exceeded those approved in the TSPs. As a result, several survey units required new ABSCs using a modified technique to demonstrate that the scan speeds were sufficiently slow. The resurvey (or verification survey) technique involved dividing the survey unit into sections equal to the physical size of the detector normally used for scanning. The detector was used to take a static reading in each section in a process dubbed ”static scanning” or ”stamping.” The following survey units were rescanned in verification surveys:

- Building 130 – Class 1 Survey Units 11, 12, 15, and 33
- Building 146 – Class 1 Survey Units 1 to 7, 12 to 22, and 41; Class 2 Survey Units 23 and 24 and 30 to 40
- Building 271 – Class 1 Survey Units 7 to 10
- Building 351A – Class 1 Survey Unit 43
- Building 406 – Class 1 Survey Units 14, 15, 21, and 22
- Building 439 – Class 1 Survey Units 2, 4, and 5; Class 2 Survey Units 3 and 6

The verification surveys were performed by TtEC and included Navy or third-party oversight to ensure that the surveys were conducted according to the approved plan. If both the initial survey and verification surveys were performed on the same surface, their results should come from the same potential population and, therefore, have the same distributions. This assumption is key to the data distribution comparison described in Section 5.2, and its validity can be tested using the two-sample Kolmogorov-Smirnov (K-S) Test to determine whether two data sets come from the same distribution.

In most cases, the initial survey scan data were removed from the *Alpha-Beta Scans and Statics.xlsx* if verification scan data were collected and recorded in *Alpha-Beta Scans and Statics 2.xlsx*. To compare the initial scan data to the verification data would require converting the data provided in the reports to text and then importing the text into a worksheet. However, the initial and verification data were found in the data files for the following:

- Building 146 – Class 2 Survey Unit 33 (wall)
- Building 271 – Class 1 Survey Units 7 to 10 (floor, wall)
- Building 351A – Class 1 Survey Unit 43 (floor, wall)
- Building 406 – Class 1 Survey Units 14, 15, 21, and 22 (floor, wall)

If the allegation has merit (that the instruments used in scanning Class 2 and Class 3 survey units were stationary), then data from the initial and verification surveys on the walls of Survey Unit 33 in Building 146 should have different distributions and fail the K-S Test. Because it is assumed that instruments used to survey Class 1 survey units (such as Building 271, Survey Unit 7) were in motion, the distributions of the initial and verification surveys should be the same and pass the K-S Test.

The following assumptions were made in developing and applying the Data Distribution Comparison method:

- The portions of a given survey unit scanned during the initial and verification surveys were the same.
- The initial and verification surveys were sampled from the same population, and the distribution of the results should have the same shape, and therefore pass the K-S Test.
- The results of the verification surveys are the true measure of the surface radiological conditions based on the survey oversight conducted.
- For a given survey unit, the radionuclide surface activity concentration remained the same between the initial and verification surveys. In the 5 to 7 years after the initial surveys, factors such as redistribution of the activity, radiological decay and ingrowth, and additional deposition of dust on the surface may have slightly changed the expected results from the verification survey. However, the nature and extent of the radiological surface activity during the verification survey is assumed to still be representative of that during the initial survey.
- The responses of different detectors used in the initial and verification surveys are not significant enough to affect the results of the K-S Tests.

## 5.2 Evaluation Method

A statistical add-in package (Realstats)[1] was used in Excel to compare two distributions (initial and verification data) using the two-sample K-S Test. The K-S Test is used to determine whether the two samples (or data sets) come from the same distribution. The null hypothesis is $H_O$: the initial and verification data come from a population with the same distribution (refuting the allegation that the survey instrument was not in motion during the initial survey). The alternate hypothesis is $H_A$: the initial and verification data come from populations with different distributions (supporting the allegation that the survey instrument was not in motion during the initial survey). The null hypothesis $H_0$ is rejected if the test statistic, the maximum deviation (*D-stat*) between the distributions, is greater than the critical value (*D-crit*) for the two sample sizes and chosen alpha. The null hypothesis $H_0$ is also rejected if the calculated *p-value* is less than the chosen alpha.

## 5.3 Data Distribution Comparison Results

Two-sample K-S Tests were performed on the gross beta cpm scan results for Building 146, Survey Unit 33 walls, and Building 271, Survey Unit 7 floors and walls. Given the number of null values in the alpha cpm results, they were not expected to be indicative of the shape of the overall distribution and were not evaluated further. The results of the K-S Test are presented on Figure 5-1 and interpreted as follows:

- $H_O$: the initial and verification data come from a population with the same distribution (refuting the allegation that the survey instrument was not in motion during the initial survey)
- $H_A$: the initial and verification data come from populations with different distributions (supporting the allegation that the survey instrument was not in motion during the initial survey)
- Building 146, Survey Unit 33 (Walls)
  - *D-stat* not > *D-crit* and *p-value* not < *alpha*
  - Fail to reject $H_O$.

[1] Found at www.real-statistics.com.

  - Conclude initial scan data came from the same distribution as the verification data and that the survey instrument was in motion during the initial survey.

- Building 271, Survey Unit 7 (Floors)
  - *D-stat* > *D-crit* and *p-value* < *alpha*
  - Reject $H_O$ and accept $H_A$.
  - Conclude initial scan data did not come from the same distribution as the verification data and that the survey instrument was not in motion during the initial survey.
- Building 271, Survey Unit 7 (Walls)
  - *D-stat* > *D-crit* and *p-value* < *alpha*
  - Reject $H_O$ and accept $H_A$.
  - Conclude initial scan data did not come from the same distribution as the verification data and that the survey instrument was not in motion during the initial survey.

Figure 5-1. Two-sample K-S Tests on Initial and Verification ABSC Beta cpm Data for Building 146, Survey Unit 33 (Walls) and Building 271, Survey Unit 7 (Floors and Walls)

The K-S Test results conflict with the expected conclusions that a true allegation would result in rejecting $H_O$ for Building 146 and failing to reject $H_O$ for Building 271. Several factors may contribute to this conflict:

- The number of results used to establish each distribution (20 to 22) is small and, therefore, may not represent the true population being surveyed.

- The residual activity in Building 146, Survey Unit 33 is homogenous, such that a stationary detector scanning a fixed location may yield the same or similar results to one that was in motion over most or all of the rest of the survey unit area. In this case, the allegation could be true, but the Data Distribution Comparison method could not be used to support the allegation.
- The survey instrument was not in motion during the initial survey in Building 271, Survey Unit 7.

The use of the Data Distribution Comparison method to support or refute allegations regarding survey instrument movement during scanning is inconclusive.

SECTION 6

# Data Duplication Query Method

## 6.1 Overview

The Data Duplication Query method was developed to evaluate survey data with respect to the allegation that data were manipulated after download from the survey instruments. No methods were identified to determine whether there was evidence of deliberate manipulation of individual results. The Data Duplication Query method was developed under the assumption that data manipulation would most likely occur by ”cutting and pasting” blocks of data rather than changing results individually. If these blocks of data appeared in the same sequential order in two or more instances in either the alpha-beta or the gamma data files, they could be identified using a query.

## 6.2 Evaluation Method

A method was developed to identify nine or more sequential data values that are repeated elsewhere in the electronic data set. There is no significance to the string length of nine values; it was chosen solely to efficiently validate the method. The method depends on the order of the data in the column being queried; in this case, the data are sorted by ID column. This approach generally preserves the data in the same order as they were collected, or as they were reported in survey reports. The query will be demonstrated using only the alpha-beta data, but the same method was applied to the gamma data. The query is only applied to the beta cpm data because the repetition of alpha cpm values (especially 0 cpm) is not unusual or unexpected.

As illustrated on Figure 6-1, two columns were added to the alpha-beta worksheet with the headers Beta CPM 9 String and Beta CPM COUNTIF. The Beta CPM 9 String column contains a function that combines the subject beta cpm cell value with the values of the following eight cells into one value, a nine-value string. For example, data for IDs 92025 through 92033 would be combined using the function =O222&O223&O224&O225&O226&O227&O228&O229&O230.” For each subsequent row, the function would shift by one, such that the next string would include values from IDs 92026 through 92034 using the function =O223&O224&O225&O226&O227&O228&O229&O230&O231.” The COUNTIF function counts the number of times the string in that row appears anywhere in the column as the worksheet is ordered, in this case by the ID column.

Figure 6-1. Equations for Duplicated Data Query in ABSC Worksheet

Figure 6-2 shows an example of the values resulting from the string and COUNTIF function. A COUNTIF value of one is expected and indicates that the string of nine beta cpm values appeared only once in the worksheet (when sorted by ID in this case). At ID 92025, the COUNTIF value increases to two, indicating

that the Beta CPM 9 String appears twice in the data. As will be shown in Table 6-1, this is the start of a string of 48 ABSC values duplicated in Building 366, Survey Unit 2.

Figure 6-2. Example Results from Duplicated Data Query in Alpha-Beta Worksheet

# 6.3 Data Duplication Query Results

The Data Duplication Query method was applied to the beta cpm data and the gamma cpm data separately. As noted in Section 2, the ABSC data for Buildings 211 and 253 were collected using four-detector arrays and as result, application of the Data Duplication Query was not tested or conducted for this initial effort. Forty instances of repeated strings of alpha, beta, or gamma cpm data were identified in the electronic data and confirmed in the survey reports submitted by TtEC. Statistics summarizing the overall duplication identified using this method[2] are presented in Table 6-1 for those buildings listed in Section 3. The number of survey units in each building excludes soil survey units. The duplicated results include all identified duplications in alpha, beta, and gamma background, and static and scan data found from within the databases. Duplicated alpha-beta results are presented in Table 6-2, and duplicated gamma results are presented Table 6-3. The duplicated records are presented (sorted by ID) in Appendix A for the alpha-beta results and Appendix B for the gamma results. Sixteen strings of duplicated alpha-beta data were identified and 24 strings of gamma data. Detailed footnotes to Table 6-2 are provided for the alpha-beta data to explain how the data were presented in the database or FSSR. This level of investigation was also completed for the gamma data but has not been included for the gamma data in Table 6-3.

While the duplication query was only applied to the beta cpm data, for nearly all the beta cpm duplications, the associated alpha cpm was also duplicated. The probability that a set of beta cpm values for one instrument and surface would be identical to another set of data for a different instrument or

[2] The results in Table 6-1 for Buildings 211 and 253 are for the ABST data only. ABSC data from Buildings 211 and 253 were not evaluated using the Data Duplication Query method because the data were collected using an array of four detectors. The format of the data and the resultant method modification was not conducted for this initial effort.

surface was not calculated, but the probability is assumed to be low. The idea that the paired alpha cpm data could be identical in both instances is assumed to be nearly impossible.

In some cases, duplicated gamma data were in buildings not listed in Section 3. In these cases, the data are presented in Table 6-2. While we reviewed the identified strings of duplicated data, we found other anomalies, indicating potential manipulation beyond cut-and-paste duplication. Examples of data that are identical in the alpha-beta values but with different surfaces surveyed are presented in Section 6.3.3. Examples where the data in the electronic files are identical but the order of the results was shuffled in the survey reports are presented in Section 6.3.4. Examples where the alpha values are the same but the beta values and the measurement times were lower by a fixed value are presented in Section 6.3.5.

Table 6 2. Summary of Duplicated Alpha and Beta Results

| Parcel | Data Type | Bldg | Sur-vey Unit | No. Points Duplicated | Foot-note | Survey Date | Reading No. | Surface | Start ID | End ID |
|---|---|---|---|---|---|---|---|---|---|---|

ABSC = Alpha-Beta Scan; ABST = Alpha-Beta Static; ABSTBKG = Alpha-Beta Static Background

F = floors, W = walls, C = ceilings

[1]Seventeen alpha values different in 2nd and 3rd strings.

[2]One alpha value different in 2nd string.

[3]Only these 400 ABSC ceiling results for Survey Unit 26 appear in the FSSR. The previous 250 ABSC wall results for Survey Unit 26 are not in the FSSR but were used (with the 400 ABSC ceiling results) in the TtEC-submitted paper, *Technical Paper Discussing Alpha Scan Speed at Hunters Point Naval Shipyard (HPNS) under Basewide Radiological Removal Action*, June 26, 2014.

[4]Same 4-value pair repeated 5 times for static results. Surface types varied within each grouping.

[5]Used as Readings 295-588 and 1-294 in report, respectively.

[6]Of the 368 results in each data set, the beta cpm values in Building 272, Survey Unit 22 are exactly 0, 100, 200, 300, 400, 500, 600, 700, or 800 cpm lower than the corresponding result in Building 810, Survey Unit 21. The alpha cpm values are different between the data sets but were not evaluated to determine whether there was a pattern of manipulation.

[7]Same instrument and time stamps - imported by two different people - possible duplicate import.

[8]Appears that data were mixed together in report. Result is groups of two rows of repeated results with same date and time in report.

[9]Appears that first two pairs were dispersed to separate places in report. First set used as Readings 3-249,1,250-398 in report and second set used as Readings 399-645,2,646-794 in report.

[10]First set used as Readings 795-1073 in report and second set used as Readings 1074-1352 in report.

[11]Seven alpha and one beta values different in 2nd string. Appears that data were mixed together in report. First set used as Readings 256-257,259,262,264,…-539,542 in report, and second set used as Readings 255,258,260,261,…-537,540,541 in report.

[12]Appears that data were mixed together in report. Result is groups of two rows of repeated results with same date and time in report. First set used as Readings 8082,8083,8085, 8088,...-9022,9024,9025 in report, and second set used as Readings 8081,8084,8086, 8087,...-9021,9023,9026 in report.

[13]The same instrument was used at the same time for each data set, but the survey materials were different, so this was not a database error. There are 16 duplicated data points in the first set (out of 20 total), 9 in the second, and 16 in the third. All the alpha and beta results are the same, but because the number of data points in the set varied, so did the number of duplicated points.

### 6.3.1 Example of Duplication and Location Manipulation

On Figure 6-3, the same four values have been repeated five different times and reported as 20 different ABST readings (ID 281175 to 281194). While the query used beta cpm to search for duplication, the associated alpha cpm result was also duplicated. In the example of Building 130, Survey Unit 5, the COUNTIF results for IDs 281118 to 281194 are 1, even though they are part of the duplicated data. Two other issues can be identified in the duplicated data. First, the order of the locations (W=wall, F=floor) have been changed between Reading Numbers 1 to 4 (W, W, F, F), 5 to 8 (W, W, F, F), 9 to 12 (F, F, W, F), 13 to 16 (F, F, F, F) and 17 to 20 (F, F, F, F). Second, the data collection times occur in two nearly simultaneous blocks on the same day. A review of the original database confirms that the duplicated data were from the same detection system and surveyor.

| ID | Data Type | Bldg | Survey Unit | Location | Rdg Num | Date | Time | Alpha CPM | Beta CPM |
|---|---|---|---|---|---|---|---|---|---|
| 281175 | ABST | 130 | 5 | W | 1 | 2/9/2009 | 10:38:17 AM | 1 | 131 |

Figure 6-3. Example of Data Duplication and Location Manipulation in Alpha-Beta Worksheet

### 6.3.2 Example of Duplication and Report Reading Manipulation

Figure 6-4 shows a portion of the 48-value duplicated ABSC string introduced on Figure 6-2 for Building 366, Survey Unit 2. The first use of the 48 values appears as Readings 47 to 94 (ID 92025 to 92072) and the second use of the 48 values appears as Readings 95 to 142. In addition to the duplication of the results, note the differences between the “Rdg Num” and “Rpt Rdg Num” columns. The latter is the “map,” indicating where the row in the database is reported in the Alpha-Beta Scan Measurement Report, an appendix to the FSSR. In this case, rather than reporting the results in the order of the Rdg Num, they were shuffled such that Rdg Num 47 to 51 became Rdg 47, 50, 52, 54, and 56 in the report (see Figure 6-6).

Figure 6-4. First Set of Duplicated ABSC Data in Building 366, Survey Unit 2, and Report Reading Manipulation

Figure 6-5 shows a portion of the repeated 48-value string as Reading 95 to 142 (ID 92073 to 92120) in the database, with Reading 95 being reported as Reading 48 in the report. As shown on Figure 6-6, this results in repeating pairs of data, that is, Rdg 47 is 0 CPM alpha, 270 CPM beta, just as Rdg 48 is 0 CPM alpha, 270 CPM beta.

Figure 6-6. ABSC Results in Building 366, Survey Unit 2, from Final Status Survey Report

### 6.3.3 Example of Duplication and Time and Beta cpm Manipulation

Figure 6-7 shows the first 20 of 368 ABSC results for Building 810, Survey Unit 21, and Building 272, Survey Unit 22. The alpha cpm results are equal for all 368 readings. The time for Building 272, Survey Unit 22, is exactly 4 hours behind the time for Building 810, Survey Unit 21, for most readings, and 3 hours, 52 minutes for the others. The beta cpm values for Building 272, Survey Unit 22, are all 0, 100, 200, 300, 400, 500, 600, 700, or 800 cpm lower than the corresponding result in Building 810, Survey Unit 21. This manipulation example was discovered because there are a few instances in the 368 readings where the difference between the survey units is zero for five results consecutively, and they were therefore identified during the duplication query.

Figure 6-7. Differences in ABSC Time, Alpha cpm and Beta cpm Results for Building 810, Survey Unit 21, and Building 272, Survey Unit 22

SECTION 7

# Sum of Statics Assessment Method

## 7.1 Overview

The Sum of Statics Assessment method was developed to evaluate static measurement data with respect to the allegation that they were manipulated after download from the survey instruments. The Duplicated Data Query could only identify sequential values that were repeated in the same order. If the order of the values was altered, use of an otherwise identical data set would not be identified. Because the routine measurements made for both background and for statics involved either 16 or 20 individual readings, the sets of readings could be compared to each other.

## 7.2 Evaluation Method

To assess whether any sets of ABST or ABSTBKG results were duplicated, but reordered, each set of results was placed in an individual column in a new Excel worksheet. The column headers include data type, building, survey unit, location, and reading numbers. For example, ST366_57_F_1-20 includes floor beta cpm static results 1 to 20 for Building 366, Survey Unit 57. The sums of each column were calculated on the same row of the worksheet, and a conditional formatting rule applied to the sums to identify any with duplicated values within the row. On Figure 7-1, three instances are shown where the sum of statics is equal to another sum.

| Static Reading | ST366_57_ F_1-20 | ST366_62_ C_1-22 | ST366_63_ C_1-22 | ST366_61_ C_1-20 | ST366_60_ ?_1-22 | ST366_54_ W&F_1-20 | ST366_67_ C_1-20 | ST366_65_ W_1-20 | ST366_68_ C_1-20 | ST366_50_ W&F_1-20 | ST366_55_ W&F_1-21 | ST366_48_ W&F_1-20 |

Figure 7-1. Example ABST Results for Sum of Statics Assessment

The worksheet was filtered to retain only the columns with duplicated sum values. The columns were then rearranged to place equal sums adjacent to each other for ease of comparison. Finally, the static results in each column were sorted from lowest to highest. The rearranged columns shown on Figure 7-2 highlight that the sum of statics values 2137, 2256, 2460, and 2477 were found twice each in the data, and the value 2469 was found three times. The static results in columns having equal sums were manually compared to assess whether the same results appeared in two or more data sets.

Figure 7-2. Culled ABST Results from Sum of Statics Assessment

## 7.3 Sum of Statics Assessment Results

Twenty-six instances of equal static sums were found in the ABST and ABSTBKG data. While there are a high number of repeated values within a set, comparison of sets with equal static sums did not indicate that any of the sets were duplicates. This methodology was not implemented on the gamma data.

SECTION 8

# Summary

This report documents the efforts to develop and validate methodologies to evaluate building survey data at HPNS with respect to allegations regarding scan speed, detector movement, and falsification of data. The developed methods include the following:

- Scan Speed and Coverage Method (Section 4)
- Data Distribution Comparison Method (Section 5)
- Data Duplication Query Method (Section 6)
- Sum of Statics Assessment Method (Section 7)

These methods were applied to Navy-provided electronic survey data from 28 buildings and 816 survey units at HPNS. The Scan Speed and Coverage method calculated the average scan speed and the minimum area covered during conduct of alpha-beta scanning. The method was applied to four survey units for verification, but the resulting rapid scan speeds (or low scan coverage) is expected to be found in nearly all survey units. The Data Distribution Comparison method was tested to determine whether data from different surveys of the same area could indicate whether the detectors were in motion in either survey. The method was used on two data sets, and based on the inconclusive results, the method is not currently recommended to assess detector movement. Two methods were developed to assess data falsification and manipulation. The first method, the Data Duplication Query, was used to identify 40 duplicated data strings in electronic data. These duplicated data strings occurred in 15 of the 28 buildings, in 49 of the 816 survey units (6 percent) and in 10,075 of the 567,517 data points (3 percent) evaluated. In addition to data duplication, additional instances and types of data manipulation were identified and presented. No instances of duplicated results were identified by additional validated methods.

The methods developed and applied during the data evaluation described in this report represent the Navy's initial effort to demonstrate the ability to assess allegations of data manipulation, and to assist in making decisions on pending dispositions of buildings at HPNS. The allegations regarding detector speed were successfully assessed using the Scan Speed and Coverage method. The detector movement allegation requires further evaluation using more or larger data sets to validate the developed Data Distribution Comparison method. The allegation of data falsification was supported by the Data Duplication Query method, which identified various means of data duplication and potential manipulation rather than the replacement of individual survey results. Because some types of data manipulation are difficult or impossible to identify, this report cannot verify that additional portions of the database have not been manipulated. The overall conclusion of this initial building radiation survey evaluation is that evidence of data manipulation and/or falsification was found in the building radiation surveys. It is concluded that some surveys have been falsified and additional data will need to be collected to support a recommendation for unrestricted radiological release at HPNS radiologically-impacted buildings.
