Coal Combustion Products Program (C2P2)

Program Name	Coal Combustion Products Program (C2P2)
Sector	Multi-Sector or Other
Subsectors	Coal
Key Stakeholders	Industry, Power Suppliers, Public Officials
Government	Federal
Agency	EPA
Services Provided	Information Resources; Partnerships
Description	This partnership is designed to help promote the beneficial use of coal combustion products (CCPs) as the resulting environmental, economic, and performance benefits. Through the C2P2 program, EPA is working to reduce or eliminate legal, institutional, economic, market, informational, and other barriers to use of CCPs. This is achieved primarily through workshops, targeted activities, and the C2P2 Challenge. Through the Challenge Program, organizations voluntarily work to increase the beneficial use of CCPs. Environmental benefits of using CCPs can include reduced greenhouse gas emissions, reduced land requirements, and reduced utilization of virgin resources. Economic benefits can include reduced cost with coal ash and slag disposal, increased revenue from the sale of ash, and savings from using CCPs over other, more costly materials. Performance benefits may result from the physical and chemical characteristics and include greater resistance to chemical attack, increased strength, and improved workability when used to replace or supplement Portland cement in concrete. High performance concrete, which can contain other recycled materials, is being used to double the life of conventional pavements and is also used in applications that are being designed to last up to 100 years.
GHGs Reduced	Multiple GHGs
